Stropping Angle
Posted by TPeters - 03 Oct 2012 22:44

When stropping what angle should be used?

If I sharpen a knife at 20 degrees should I strop at the same angle or should I strop at a lessor angle, say 19 degrees? The only strops I currently have are leather.

Or is this practice only used when you are trying to convex the bevel. Say you sharpen at 17 degrees, micro bevel at 20 degrees then should you strop at 19 degrees?

This knife sharpening sure can get involve but I am having a blast!

Welcome Alejandro, thanks for joining in. The guys are right that the index is a great place to start. It's also helpful to just ask any old question that comes up, there is no such thing as a stupid one. What you'll find is that one or many people will answer it pretty quickly with a great deal of friendliness and lots of experience. It's a wonderful community.

Hmmm. Sure sounds like a lot of smarty talk to me. I am new to this forum and I would love to be able follow along. Is there someplace in the forums I can read up on the basics so I can understand? Thanks.

Thanks Clay! These photographs are awesome! The best edge photo’s I’ve seen in my life! (And the best ones I’d seen before that were yours, too :)

And very revealing. No more guessing and dubious interpretation. Now we can see without a doubt how effective stropping is. Man, I didn't know it was *that* effective.

Finally towards a scratch size comparison chart?
. Based on the objective effect stones/strops have on the edge rather than on some "specfications" by manufacturers according to different standards that are hard to verify?

Definitely! My goal is to do a comparison chart with photos of the results of each grit like we already have but at the new, higher resolution and starting with a completely clean slate. The current chart shows the grits progressing from one to the next, getting finer as it goes, but the potential problem is that we might still be seeing scratches from a previous stone. If I start with a totally polished sample for each grit, then we'll know for sure that we're only seeing the scratches of that particular grit. Of course such a chart won't teach much about the effects of the strops after the stones, so maybe I'll create a library of different grit jumps and put it in a permanent place so it doesn't just get buried in the forum.

_____

Alejandro

In the forum index about sharpening techniques.

www.wickededgeusa.com/index.php?option=c...atid=6&Itemid=63

At the bottom of the home page there are some sharpening videos also under "Demos"

If only interested in stropping, search on it.
